

MIDNIGHT BUILDATHON · WAVE 2 · COMPACT + MIDNIGHTJS

Kymider

**Prove solvency privately. Post 110% collateral,
not 150%.**

A borrower proves in zero knowledge that their committed balance, debts and income clear a lender's bar. The Loan contract then lets the lender offer only the tier's collateral, 110%, and only the borrower's acceptance makes it binding. The figures never enter a transaction.

ON-CHAIN PROOF

[DEVNET-PROOF.md](#): 31 tx, 45/45
checks · Preprod pending

THE PROBLEM

DeFi lenders cannot see a borrower's finances, so every borrower pays the worst-case price.

A lending protocol cannot ask for bank statements. It treats every borrower as unknown and asks for **150% collateral**. A borrower with a clean balance sheet pays the same as one without.

Disclosing finances is the fix the setting cannot accept: it puts a financial history on a public chain or in a counterparty's database. The lender does not want the data. It wants one answer: **does this borrower clear our bar?**

THE BORROWER

Locks up capital it could put to work, because it cannot show what it has without showing everything.

THE LENDER

Cannot offer a cheaper tier, because it has no signal it can rely on.

DISCLOSURE

Turns a one-bit question into a permanent data liability for both sides.

THE NUMBER · A 10,000 LOAN

One yes/no answer, 4,000 less collateral.

NOT VERIFIED · TIER STANDARD

15,000

150% of principal. What every borrower posts today.

VERIFIED · TIER VERIFIED

11,000

110% of principal. Enforced in-circuit: the exact floor, nothing else passes.

27% less collateral for the same loan (4,000 of 15,000), or **36% more borrowing** on the same collateral (1.5 / 1.1). The lender learns VERIFIED. It never learns the balance.

HOW IT WORKS · ONE LOAN INSTANCE PER LOAN

The proof fixes the price. Only the borrower makes it binding.

LOCAL	The borrower commits $H(\text{tag}, H(\text{balance}, \text{debts}, \text{income}), \text{salt})$. Figures and the 32-byte salt stay on the device.
CHAIN	<code>deploy Loan(lender, terms, commitment)</code> and <code>LoanDirectory.list</code> . Terms are public.
CHAIN	<code>quoteTerms</code> A net-worth floor, a max DTI, an expiry at least 30 min out. At most 3 per loan; none while a verified tier is live.
PROVE	<code>proveTier</code> Facts are private circuit inputs; the circuit checks them against the commitment and writes VERIFIED or STANDARD .
CHAIN	<code>underwrite(collateral)</code> An offer, accepted only if <code>collateral = floor(principal × 110% or 150%)</code> .
REFUSED	A 150% ask on a verified borrower: <code>collateral does not match the tier</code> .
ACCEPT	<code>accept</code> The borrower accepts the offer, and only then is the loan ACTIVE . Or <code>declineOffer</code> : back to APPLIED .
CHAIN	<code>disburse, repay × N, markDefault</code> after a 3-day grace. Lateness is block time.
PROVE	<code>proveTwoRepaid</code> Two private Merkle paths, <code>checkRoot</code> against the directory. Public result: “2 repaid loans”.

Compact has no division. The client computes each quotient; the circuit checks it by cross-multiplying: $v \times 10000 \leq p \times \text{ratio} < (v+1) \times 10000$.

The facts are private. The loan is public, because a lender has to enforce it.

DATUM	LEDGER	MECHANISM
Balance, debts, income	Private	Circuit inputs to proveTier; only a salted persistentHash of them is public
Secret key, facts salt, history seed, payment nonces	Private	Witnesses localSk, factsSalt, paymentNonce
Which loans back a history proof	Private	HistoricMerkleTree paths + checkRoot. A key's repaid listings stay countable
Tier VERIFIED / STANDARD and its expiry	Public	disclose(): one yes/no answer per proof, at most 3 per loan
Quote, terms, collateral, balance owed, due date	Public	Enforced by block time and caller checks
Each repay amount, payments made, late payments, history chain head	Public	Amounts are transaction inputs; Counter + hash chain an auditor can check offline

LIVE CONSOLE · THE BORROWER AND THE LENDER

1 No install. The console runs the compiled contracts in the browser.

2 Both prices up front. 11,000 if verified, 15,000 if not.

3 Prove tier → VERIFIED. One word reaches the ledger.

4 The lender's view. Tier VERIFIED; balance, debts, income *not disclosed*. The only offer: 11,000.

3 · OFFER

Collateral at this tier

11,000110%

150% would be ~~15,000~~. The borrower posts 4,000 less.

ENFORCED BY THE CONTRACT

underwrite takes exactly one collateral figure: 110% of the principal while a VERIFIED tier is

5 150% refused. "collateral does not match the tier", the contract's own assert.

Demo: Disclose one of this browser's loans...

VERIFIED

The disclosure opens this loan's on-chain history exactly: 3 payments, 1 late, \$11,000 repaid. Nothing was added, dropped, reordered or edited.

What the disclosure opens

PROVEN

#	AMOUNT	TIMELINESS	CHAIN HEAD AFTER
1	\$3,667	LATE	0xb6f02d2b...a25b
2	\$3,667	ON TIME	
3	\$3,666	ON TIME	

WHAT THE PUBLIC LEDGER SHOWS

Loan	0xb6f02d2b...a25b
Status	repaid

7 Auditor (Wave 3 preview). The exported history lands exactly on the on-chain hash: complete and unaltered.

Two ledgers for one loan

The private log opens the public commitment, and nothing else does.

PAYMENT LOG

PRIVATE TO THIS DEVICE

#	PAID AT	AMOUNT	TIMING
1	2026-11-03 04:51	\$3,667	LATE
2	2026-11-03 04:51	\$3,667	ON TIME
3	2026-12-03 04:51	\$3,666	ON TIME

Kept by this browser. The ledger state holds how many payments were made, how many were late, the balance, and the history commitment these entries open; each payment's amount is visible in its transaction.

PUBLIC ON-CHAIN RECORD

Anyone can read this

Loan instance	0xb6f02d...a25b
Borrower key	0x39f7d3...078b
Lender key	0x09e093...d5fb
Facts commitment	Matches solvency instance
Status	REPAID
Tier	VERIFIED · 110%
Collateral required	\$11,000
Balance owed	\$0
Payments made	3
Late payments	1
History commitment	0xda566b59...54ca91
Repaid loans proven	none
Directory	LISTED · REPAID

The ledger state keeps counts, the balance and one history commitment, not a list of payments. Each repayment still moves the public balance, so its amount can be read from the transaction; what the

6 Repaid, 1 of 3 late. Each amount is a public transaction input; the device's log adds the nonces that rebuild the on-chain history hash.

Live chain

Live · Preprod

Live chain

Deployed Kymider contracts and their public ledgers, read from the Preprod indexer. Nothing on this screen is simulated.

Not deployed to Preprod yet

The deploy job writes deployments/preprod_3.json with the contract addresses and transaction hashes once it has run on Preprod. Until then there is nothing on chain to show, and this screen will not make anything up.

WALLET

NOT CONNECTED

Reading the chain needs no wallet. To act on Preprod, install the Lace wallet with Midnight enabled.

Connect Lace

SOURCE

NetworkPreprod

IndexerIndexer.preprod.midnight.network

Reading needs no wallet: public ledger state is public. Each contract's state is fetched as serialized bytes and decoded with the same compiled contract the circuits run, so a field shown here is the field on chain.

8 Live. Reads Preprod through the indexer. Today it says "Not deployed to Preprod yet": the Preprod run is pending.

ENGINEERING EVIDENCE · EVERY NUMBER LINKS TO THE REPO

Refusals are the product, so every refusal has a test.

4

COMPACT CONTRACTS

22 circuits plus exported pure helpers. Language 0.23, toolchain 0.31.1, compiled in CI on every push.

307

OFFLINE TESTS

Drive the compiled contracts, every refusal included. `npm run test:unit`

18

DEVNET CASES

Two wallets, real ZK proofs, node + indexer + proof server in Docker. Full flow: 31 tx, 45/45 read-back checks, [DEVNET-PROOF.md](#).

46

BROWSER TESTS

Playwright on the console build at 1440 and 390 px: the judge path and each refusal, in CI.

Time is tested to the second: quote expiry, a payment exactly on its due date, a default one second inside the grace period. The payment-history chain is rebuilt from the seed and compared byte for byte. Forged Merkle paths, someone else's record and a loan vouching for itself are all refused.

MARKET AND ADOPTION

The buyer is a DeFi lender that wants a cheaper tier without KYC.

WHO

Lending protocols that over-collateralize at 150% and up because they cannot assess a borrower. Their borrowers with balance sheets the protocol cannot see.

ADOPTION PATH

One protocol adds a verified tier. The borrower generates one proof per loan. No regulatory change, no new identity system. Then regulated lenders, through the Wave 3 auditor and attestation channel.

THE DEPENDENCY

Figures are self-reported today, so anyone can get VERIFIED. A data provider co-signing facts into private state makes the tier worth a lower price. That is a partnership, not more cryptography.

WHAT CHANGED SINCE WAVE 1

Wave 1 proved creditworthiness. Wave 2 makes the proof buy a price.

	WAVE 1	WAVE 2
Contracts / circuits	2 / 9	4 / 22 · + Loan, LoanDirectory
What a proof buys	PASS / FAIL	110% vs 150% collateral, enforced in-circuit, binding on the borrower's acceptance
Compact features	Witness, commitments, Map/Set, Counter	+ block time, HistoricMerkleTree + checkRoot, salt and nonce witnesses, division-free quotient checks
Offline / browser tests / devnet cases	54 / 0 / 11	307 / 46 / 18
On-chain	Local devnet	Local devnet in CI on every push: 31 proven transactions, 45/45 read-back checks (DEVNET-PROOF.md). Preprod: pending
Console	Solvency screens	+ loan desk, portfolio, auditor preview, Live view
AKINDO record	Repo unlinked, private, tagged Base	Fix pending: connect the repo, make it public, tag Midnight

ROADMAP · AND WHAT IS SIMULATED TODAY

Wave 3 closes the gaps we name.

AUDITOR VIEWS

The preview exists: the auditor checks an exported payment history against the on-chain hash, offline. It proves integrity; the amounts are already public. Wave 3 adds a read-only regulator dashboard.

ATTESTED PROVENANCE

A data provider co-signs facts at ingestion. The same allowlist stops a borrower minting repayment records by lending to themselves.

BANK CHANNEL

Signed, expirable attestations a bank verifies offline, with no Midnight node on its side.

Simulated today: no token moves (collateral and balances are figures in contract state); figures are self-reported, so VERIFIED is free today; the browser console executes circuits without generating proofs or using a wallet. Unaudited.

KYMIDER · WAVE 2

Prove it privately. Post 110%.

TEAM

Kymider team. One builder: contracts, client, console, CI.

THE ASK

An introduction to one Midnight lending protocol, and one data provider willing to co-sign facts.
